

# Proposed Transportation Control Measure Substitution of Three Toll Road Capital Improvement Projects (FTIP Project IDs: 10254, ORA050, & ORA051) with Three New Traffic Signal Synchronization Projects

## Introduction

The Transportation Corridor Agencies (TCA) previously committed to three toll road capital improvement projects along portions of TCA facilities within Orange County: the San Joaquin Hills Transportation Corridor (FTIP Project ID: 10254); the Eastern Transportation Corridor (FTIP Project ID: ORA050); and the Foothill Transportation Corridor-North (FTIP Project ID: ORA051). These three projects are included as committed TCM's in the Southern California Association of Governments' (SCAG) 2020 RTP/SCS (Connect SoCal), 2021 FTIP, and SCAQMD's 2016 South Coast AQMP/Ozone SIPs. Below are the summary project descriptions of these three committed TCMs. Their 2021 FTIP project sheets including detailed project information are included in **Attachment A**.

- The San Joaquin Hills Transportation Corridor (SJHTC, SR-73) is a 15-mile managed toll facility between Interstate 5 (I-5) in San Juan Capistrano and the non-tolled portion of the SR-73 in Irvine. Planned improvements include one (1) additional tolled lane for mixed flow traffic in each direction, plus climbing and auxiliary lanes by 2022.
- The Foothill Transportation Corridor-North (FTC-N, SR-241) is a 12.7-mile managed toll road between Oso Parkway and the Eastern Transportation Corridor. Planned improvements include two (2) additional tolled lanes for mixed flow traffic in each direction, plus climbing and auxiliary lanes by 2022.
- The Eastern Transportation Corridor (ETC, SR- 241/261/133) is a 26.4-mile managed toll road that connects SR-91 to I-5 via SR-261 and SR-133. Planned improvements include two (2) additional tolled lanes for mixed flow traffic in each direction, plus climbing and auxiliary lanes by 2022.

Note that all the existing TCA facilities and the three TCA capital improvement TCM projects are tolled lanes, open to all vehicles, and without discounts to HOVs. In addition, all the three TCA committed TCMs would add toll capacity and are in the TCM category of HOV lanes and their pricing alternatives.

Based upon TCA's 2018 Capital Improvement Program, adopted on June 14, 2018, these committed TCMs will be delayed beyond the scheduled completion dates. Three substitute TCM projects (a combined 33 miles of new signal synchronization projects) are now proposed as a replacement TCM to the previously committed projects.

## Description of Proposed Substitute Projects

Orange County Transportation Authority (OCTA) is proposing substitute projects as a replacement to the three previously committed TCMs. The proposed substitute projects consist of three signal synchronization projects spanning approximately 33 miles of roadway and coordinating 136 signalized intersections. The projects involve nearly 10 agencies and have budgets of approximately \$10,600,000. The proposed substitute projects will improve traffic congestion by optimizing travel times on these high-volume corridors. The table below shows the three corridors and the respective details.

Detail on the Replacement Projects					
Arterials	Project Intersections	Project Miles	Participating Agencies	Approximate Project Cost	Fund Sources
1 <sup>st</sup> Street / Bolsa Avenue	55	13.1	5	\$3,900,000	Measure M2 and Local Funds
Alton Parkway	50	12.8	2	\$3,800,000	Measure M2 and Local Funds
Portola Pkwy/ Santa Margarita Pkwy	31	7.6	3	\$2,900,000	Measure M2 and Local Funds
<i>Summary</i>	<i>136</i>	<i>33.5</i>	<i>10</i>	<i>\$10,600,000</i>	<i>Measure M2 and Local Funds</i>

The proposed substitute projects will be implemented by December 2022. Current funding, as part of Measure M2 and local city matching funds, will be used for these three signal synchronization projects. Project descriptions are listed below and a map of the locations of both the committed and substitute projects is in **Attachment B**. Note that these proposed substitute TCM projects are not in the SCAG's 2021 FTIP yet but will be amended into the 2021 FTIP upon completion of the TCM substitution.

### 1. Portola Parkway Signal Synchronization Project (SSP)

The Portola Parkway SSP implements optimized signal timing between Paloma Parkway to Plano Trabuco Road (7.6 miles). The project includes select upgrades to key equipment including Advanced Traffic Controllers (ATC), communications, and detection.

### 2. 1st Street/Bolsa Avenue SSP

The 1st Street/Bolsa Avenue SSP implements optimized signal timing between Bolsa Avenue to Newport Avenue (13.1 miles). The project includes select upgrades to key equipment including ATC, communications, and detection.

### 3. Alton Parkway SSP

The Alton Parkway SSP implements optimized signal timing between Red Hill Street to Portola Parkway (12.8 miles). The project includes select upgrades to key equipment including ATC, communications, and detection.

#### Compliance with TCM Substitution Requirements

- **Equivalent Emissions Reduction:** OCTA has analyzed the countywide emissions of the substitute projects relative to those of previously committed TCM projects. The substitute projects will provide equivalent emission reductions. OCTA used the Orange County Transportation Analysis Model (OCTAM), Emission Factors (EMFAC2017) model, and Congestion Mitigation and Air Quality Improvement Program Emissions Calculator Toolkit (CMAQ Toolkit) for the analysis of the previously committed and proposed substitute alternatives. The following three sections document the OCTAM Model Information, the Emissions Analysis Methodology, and the Emissions Analysis Findings.
- **Similar Geographic Area:** The proposed substitute projects and the previously committed TCM projects are both located in the Orange County portion of the South Coast Air Basin.
- **Full Funding:** Current funding is available for the proposed substitute projects as documented under the previous section Description of Proposed Substitute Projects.
- **Similar Time Frame:** The proposed substitute projects will be operational by December 2022, equivalent to the schedule of the previously committed TCM projects.
- **Timely Implementation:** The proposed substitution is the means by which the obstacles to implementation of previously committed TCM projects is being overcome.
- **Legal Authority:** OCTA has the legal authority and personnel to implement and operate the proposed substitute projects.

#### OCTAM Model Information

OCTAM is a four-step (trip generation, trip distribution, mode choice, and trip assignment), trip-based travel demand model built on the TransCAD platform. The current model version 5.0 uses 2010 Census data and the SCAG household travel survey to help calibrate the model. The assumptions used in the current model for future forecasting are based on demographic projections from Orange County Projections 2018 and the SCAG 2020 RTP/SCS.

OCTAM forecasts travel demand with a base year of 2016 and a future forecast year of 2045. It is consistent with SCAG's regional travel demand model as it incorporates the most recent approved socio-economic data for Orange County and the surrounding region at the time it was developed.

### CMAQ Toolkit

The purpose of the CMAQ Toolkit is to provide users a standardized approach to estimating emission reductions from the implementation of CMAQ projects, including signal synchronization. The CMAQ Toolkit uses emission rates for highway vehicles based on a series of project-scale and national-scale runs of the Motor Vehicle Emission Simulator as well as other data sources. The CMAQ Toolkit is available at the following site: <https://www.fhwa.dot.gov/>. See **Attachment C** for the input and output summaries for the three signal synchronization CMAQ Toolkit applications.

### Emissions Analysis Methodology

The emissions were calculated for the previously committed TCM projects and the proposed substitute projects. A multi-step approach was used that combined the OCTAM, EMFAC, and the CMAQ Toolkit. This methodology was developed with the guidance of California Air Resources Board (CARB) staff to better estimate the emissions reduction from signal synchronization improvements. The following process was used:

Step 1: Obtain daily vehicle miles traveled (VMT) and speed data for freeways and arterials from OCTAM for both the previously committed and proposed substitute projects for forecast year 2045. The coding of the alternatives was consistent with OCTAM modeling practice and used the 2020 RTP/SCS network. **Attachment D** includes additional modeling details and summary of modeling files. **Attachment E** includes 2045 OCTAM model output summary statistics for Orange County.

Two alternatives were modeled using OCTAM. The previously committed TCA TCM projects as described earlier were modeled in an alternative referred to as the "TCA TCM Projects" analysis. The second alternative did not include either the previously committed TCM projects or the proposed substitute TCM projects. This "With No Projects" alternative was used as a basis for the "Proposed TCM Substitute Project" analysis, which also used the CMAQ toolkit to estimate the emissions benefits of the replacement signal synchronization projects (see Step 3 below). The "With No Projects" alternative also provides a point of comparison.

The OCTAM forecasts were post-processed using the National Cooperative Highway Research Program (NCHRP) 255 process. This process provides a standard methodology to refine forecasted volumes on links based on a combination of base year traffic counts, base year model estimates, and forecasted model estimates using incremental adjustments. The output of the travel demand model and post-processing

includes loaded link information, intrazonal travel speeds, and intrazonal travel volumes for all time periods for the alternatives.

Note that the additional toll lanes are part of the existing toll road management and are only available to drivers willing to pay a toll. The projects were programmed and budgeted in the 2019 FTIP Consistency Amendment #19-12.

Step 2: The Emission Factors (EMFAC2017) model was developed by the California Air Resources Board and is used throughout California to calculate emission from motor vehicles, such as passenger cars and heavy-duty trucks, operating on freeways and local roads for typical summer, winter, and annual conditions. EMFAC model outputs include total emissions for all criteria pollutants for all Orange County.

A spreadsheet tool has been created to modify EMFAC input data to reflect the results of OCTAM runs. The tool was run for the base year and forecast year 2045 using the extracted information from Step 1 as input to update the VMT and vehicle speed data needed by EMFAC. Both the "TCA TCM Projects" and the "With No Projects" alternatives were modeled in EMFAC. This process was performed multiple times for the modeled alternatives in order to analyze conditions for summer, winter, and averaged annual timeframes.

Step 3: For the emission reductions from the implementation of the three signal synchronization projects, the CMAQ Toolkit methodology was applied to account for signal synchronization benefits. The CMAQ toolkit was run three times to analyze each signal synchronization project separately. The required input data was collected for each corridor and directly used in the tool, except as described below.

To estimate future-year volumes for the input, observed Average Annual Daily Traffic and peak-hour volumes were factored up using growth factors derived from OCTAM. For each corridor, base year and future year model volumes were obtained for a typical segment to estimate the growth. The truck percentages were estimated from similar arterial corridors in Orange County, as truck data for the specific three corridors was not available.

The CMAQ toolkit estimated emission reductions for each of the three signal synchronization projects. These numbers were summed together, and the totals were subtracted from the EMFAC emissions results of the "With No Projects" analysis to find the emissions of the "Proposed TCM Substitute Projects."

Step 4: Compare the emissions output from Steps 2 and 3 between the alternatives to identify the emissions-related improvements from the proposed substitute TCM projects.

Note that interpolation of travel activity data between base year 2016 and forecast year 2045 (horizon year) results were used to estimate the emissions for interim year 2022 (completion year) and 2037 (2015 8-hour ozone standard attainment year).

## Emissions Analysis Findings

The projected emissions from the previously committed TCM projects were compared with those of the proposed substitute projects using the methodology described in the previous section. The results demonstrate that the proposed substitute TCM will yield less than or equivalent amounts of emissions compared with the previously committed TCM for all criteria pollutants for all milestone years. Emissions of all applicable criteria pollutants (Ozone – ROG & NO<sub>x</sub>, CO, PM<sub>2.5</sub>, and PM<sub>10</sub>) for the three forecast years (2022, 2037, and 2045) are summarized in the tables below.

## Year 2022

### Emission Reductions (Summer) - Ozone (Kilograms/Day)

	TCA TCM Projects	Proposed TCM Substitute Projects
ROG	- 0.4	- 0.8
NOx	- 0.1	- 4.5

### Emission Reduction (Winter) - Carbon Monoxide, Nitrogen Dioxide (Kilograms/Day)

	TCA TCM Projects	Proposed TCM Substitute Projects
NOx	- 0.1	- 4.5
CO	- 9.7	- 44.8

### Emission Reductions (Annual) - PM<sub>10</sub>, PM<sub>2.5</sub> (Kilograms/Day)

	TCA TCM Projects	Proposed TCM Substitute Projects
ROG	-	- 0.4
NOx	- 0.1	-5.4
PM10	-	- 5.1
PM2.5	-	- 0.9

## Year 2037

### Emission Reductions (Summer) - Ozone (Kilograms/Day)

	TCA TCM Projects	Proposed TCM Substitute Projects
ROG	- 1.5	- 2.8
NOx	- 0.3	- 15.8

### Emission Reductions (Winter) - Carbon Monoxide, Nitrogen Dioxide (Kilograms/Day)

	TCA TCM Projects	Proposed TCM Substitute Projects
NOx	- 0.4	- 15.8
CO	- 33.7	- 156.8

### Emission Reductions (Annual) - PM<sub>10</sub>, PM<sub>2.5</sub> (Kilograms/Day)

	TCA TCM Projects	Proposed TCM Substitute Projects
ROG	- 1.5	- 2.9
NOx	- 0.4	- 15.8
PM10	-	- 17.7
PM2.5	-	- 3.2

## Year 2045

### Emission Reductions (Summer) - Ozone (Kilograms/Day)

	TCA TCM Projects	Proposed TCM Substitute Projects
ROG	- 2.0	- 4.0
NOx	- 0.4	- 21.8

### Emission Reductions (Winter) - Carbon Monoxide, Nitrogen Dioxide (Kilograms/Day)

	TCA TCM Projects	Proposed TCM Substitute Projects
NOx	- 0.4	- 21.8
CO	- 46.7	- 216.5

### Emission Reductions (Annual) - PM<sub>10</sub>, PM<sub>2.5</sub> (Kilograms/Day)

	TCA TCM Projects	Proposed TCM Substitute Projects
ROG	- 2.0	- 4.0
NOx	- 0.4	- 21.8
PM10	-	- 24.5
PM2.5	- 0.1	- 4.4

	Kilograms/day	Kilograms/day	Kilograms/day
Carbon Monoxide (CO)	24.493	59.972	84.466
Particulate Matter <2.5 µm (PM <sub>2.5</sub> )	1.081	0.540	1.621
Particulate Matter <10 µm (PM <sub>10</sub> )	6.655	2.563	9.218
Nitrogen Oxide (NOx)	3.630	3.674	7.284
Volatile Organic Compounds (VOC)	0.593	0.785	1.378
Carbon Dioxide Equivalent (CO <sub>2</sub> e)	9,934.215	8,617.225	18,551.441
Total Energy Consumption (MMBTU)	129.993	113.095	243.088

### **Additional Modeling Details and Summary of OCTAM Files**

OCTAM was used to develop future 2045 forecasts of VMT by speed bin. The following provides details on the modeled alternative:

- TCA TCM – Previously committed project alternative 2045
  - With the three committed TCA TCM projects (10254, ORA050, & ORA051) coded into the transportation network
- No Build – Removal of previously committed project alternative 2045
  - With the three TCA TCM projects removed

The highway network for each scenario includes the input scenario assumptions. The four fixed-format binary files in the asn-LVOL subdirectories contain the post-processed forecast outputs.

Key data fields in the TransCAD Geographic File (TCMBase.DBD and TCMTCARepNB.DBD):

- AB\_LN/BA\_LN: Number of lanes in the AB/BA directions
- AB\_LVOL/BA\_LVOL: Post-processed forecast volumes in the AB/BA directions

The modeling output files are attached to this correspondence. Each scenario is packaged in a separate zip file:

- TCMTCA.zip – TCA TCM
- TCMNoBuild.zip – No Build

The forecast outputs were post-processed per the NCHRP-255 approach. EMFAC2017 was then used to forecast emissions using VMT by speed bin from the two OCTAM runs.
